avoid copy-pasting the same infrastructure code across multiple projects.

Q 13 What does the -auto-approve flag do in terraform apply?

Answer: It skips the manual yes/no confirmation prompt. Useful in automated CI/CD pipelines where there is no human to type yes, but should never be used carelessly in production.

Q 14 What command lists all resources currently tracked by Terraform?

Answer: terraform state list — It shows every resource in the current state file, giving you a quick overview of everything Terraform is managing.

Q 15 What does state locking do and why is it important?

Answer: State locking prevents two engineers from running Terraform simultaneously against the same state file. Without it concurrent runs cause corruption and unpredictable infrastructure changes.

Terraform is not just a tool.
It is how modern teams own their infrastructure.
